CVE priority

Ordered by: listed in CISA KEV (exploited in the wild), then exploited according to SSVC, then public exploit code, then EPSS (probability of exploitation in the next 30 days), then CVSS.

CVE-2026-86596 not in KEV · public exploit · EPSS 1.5% · CVSS 9.8 · #118
CVE-2026-120518 not in KEV · no public exploit · EPSS 0.78% · CVSS 9.1 · #30
CVE-2026-120534 not in KEV · no public exploit · EPSS 0.31% · CVSS 9.8 · #29

CISA KEV catalog 2026.11.06: 1,769 vulnerabilities known to be exploited.
EPSS: 3 of 3 CVEs scored. A CVE published today usually gets its first score the next day.
SSVC decisions (exploitation, automatable, technical impact): 1 of 3 CVEs have one.
Public exploit code: 1 of 3 CVEs have a published exploit or a proof-of-concept repository (checked once a day).

MEDIUM

Date: 2026-11-03 07:18
Source type: Vulnerability database
UUID: CVE-2026-120534

Description: The Advanced Custom Fields: Extended PRO plugin for WordPress is vulnerable to Limited Code Injection in all versions up to, and including, 0[.]9[.]2[.]6 via the render_field function. This is due to insufficient validation of form configuration parameters before merging into field settings and passing to call_user_func_array in the render_field method. This makes it possible for unauthenticated attackers to call arbitrary WordPress functions with controlled arguments. Method 1 requires the administrator to enable the non-default 'shortcode_preview' setting for the target form, while Method 2 requires the server environment to lack OpenSSL functions, causing ACF Pro's acf_decrypt to fall back to unverified base64 decoding.

MEDIUM

Date: 2026-11-03 07:18
Source type: Vulnerability database
UUID: CVE-2026-120518

Description: The BuddyPress XProfile Image Field plugin for WordPress is vulnerable to arbitrary file deletion in all versions up to, and including, 3.1.0. This is due to bpxp_image_field_update_on_user_activation() calling unlink() on a path built from visitor-supplied signup metadata with no realpath() resolution, no containment check against the profile-image directory and no extension allow-list. Submitting a zero-byte file with the 'field_N_hidden' parameter during registration makes the plugin store the raw value, which is then resolved against the document root when the pending signup is activated. This makes it possible for unauthenticated attackers to delete arbitrary files on the server, which can easily lead to remote code execution when the right file (such as wp-config.php) is deleted. Requires open registration and an image-type profile field on the signup form.

Preview: The actor says they found a vulnerability in an unnamed web application service that sells phone numbers. They claim access to roughly 15,600 receive-only VoIP numbers plus much of the services internal data. The numbers are reportedly flagged by Telegram/WhatsApp but accepted by platforms such as TikTok, Instagram, Reddit, Facebook and Twitch, and by banking apps. The actor says they tested some on Sumsub and asks the community whether the numbers have resale value.

MEDIUM

Date: 2026-11-03 00:17
UUID: CVE-2026-86596
Source type: Vulnerability database

Description: The s2Member plugin for WordPress is vulnerable to Remote Code Execution in all versions up to, and including, <= 260927 via the 'item_name' parameter parameter. This is due to insufficient sanitization in strip_php_tags_deep(), which only strips literal '<?' sequences, combined with a post-interpolation placeholder cleanup that reassembles a valid '<?php' opener after the attacker-controlled value has already been embedded in the email template. This makes it possible for authenticated attackers, with custom-level access and above, to execute code on the server.
