Description: IBM API Connect 10[.]0[.]8[.]0 through 10[.]0[.]8[.]12 and 12[.]1[.]0[.]0 through 12[.]1[.]1[.]2 could allow a remote authenticated attacker to execute arbitrary commands due to OS command injection. User-supplied input is not properly neutralized before it is passed to the operating system, which could allow commands to run on the underlying host.

Description: Maersk is one of the world's two largest container lines: founded in 1904, headquartered in Copenhagen, roughly 100,000 employees in about 130 countries, and USD 55.5 billion in revenue in 2024, with around USD 12 billion of EBITDA. Your contract-logistics arm, the former LF Logistics, runs fulfilment for many of the world's largest consumer brands. Five million dollars is roughly four hours of that EBITDA.

We hold approximately 100 GB of data from your OCF / LF Logistics platform:

- 29,297 driver records, 16,093 of them with plaintext passwords

- 16,123 staff accounts, including 33 SUPER_ADMIN accounts
- 18,913 delivery recipients with names and street addresses
- 64,665 signed delivery receipts (214,107 documents in total)
- 14.44 million inventory rows, 189,248 purchase orders, 334,432 ASNs
- 27,842 mobile device logs containing phone numbers, emails and IMEIs

You have 30 days to contact us and pay USD 5,000,000 in bitcoin

Emails with instructions will be sent to you shortly, if you have failed to receive them,

#77 [Critical CVE] CVE-2026-19803: The Printcart Store – Web to Print Product Designer for WooCommerce plugin for WordPress is vulnerable to...

MEDIUM

Date: 2026-11-07 05:28
UUID: CVE-2026-19803
Source type: Vulnerability database

Description: The Printcart Store – Web to Print Product Designer for WooCommerce plugin for WordPress is vulnerable to Arbitrary File Upload in all versions up to, and including, 2.13.2. This is due to the `nbu_crop_image` AJAX handler accepting a user-supplied `url` parameter that `Nbdesigner_IO::convert_url_to_path()` concatenates onto the uploads base directory without normalizing or stripping `../` sequences, and then deriving both the output directory and output file extension via `pathinfo()` from the same attacker-controlled path — with no `stripImage()` call before `writeImage()` is invoked. This makes it possible for unauthenticated attackers to write attacker-controlled PHP content to arbitrary locations outside the uploads directory, resulting in remote code execution when the written file is subsequently requested. This vulnerability is only exploitable when the `nbdesigner_upload_popup_style` site option is set to `a` (Advanced Upload Popup), which causes the handler to be registered for unauthenticated requests; however, the required `save-design` nonce is printed on the fully public frontend `upload-design-file` page, making it trivially obtainable by any anonymous visitor once that configuration is active.

#107 [Critical CVE] CVE-2026-93754: The payever – WooCommerce Gateway plugin for WordPress is vulnerable to arbitrary file upload leading to...

MEDIUM

Date: 2026-11-07 04:29
UUID: CVE-2026-93754
Source type: Vulnerability database

Description: The payever – WooCommerce Gateway plugin for WordPress is vulnerable to arbitrary file upload leading to remote code execution in various versions up to, and including, 4.8.0. Three WooCommerce-API callbacks (payever_set_sandbox_api_keys, payever_toggle_subscription, payever_synchronization_incoming) are registered with no authentication, capability check, or nonce, and the upload_image() routine writes a remotely fetched file to the public uploads directory using an attacker-controlled basename() BEFORE validating the file type. This makes it possible for unauthenticated attackers to write an executable PHP file and achieve remote code execution. NOTE: the token-recovery leg of the full chain depends on the plugin's outbound validateToken() call to Payever's service; the unauthenticated hard-coded-credential identity overwrite (CWE-862/CWE-798) is independently exploitable.
