#13 [Threat Campaign] Beware of Phishing Email Disguised as Purchase Order Confirmation Request (Xloader)

CRITICAL

Date: 2026-11-13 10:07
Actors: XLoader
Source type: Threat intelligence community
UUID: 6af6c5535313263a193f072b

Description: A phishing campaign distributes XLoader infostealer through emails disguised as purchase order confirmation requests. The attack chain begins with a malicious DOCX file that exploits Word's altChunk feature to execute an embedded RTF document. This RTF exploits CVE-2017-11882 through OLE objects to execute a VBS script, which drops encoded data and launches PowerShell scripts. The PowerShell scripts establish persistence through registry modifications and deploy a loader that decrypts and executes XLoader version 8.9 in memory. The final payload steals system information, browser credentials, and can download additional malware while communicating with its command and control server.

#14 [Threat Campaign] European Refrigeration Systems Cyber Sabotage

Actors: Cyber Av3ngers
Sector: Retail, Healthcare
Source type: Threat intelligence community
Country: Belgium, Estonia, Finland, France, Germany, Ireland, Italy, Luxembourg, Netherlands, Portugal, Romania, Sweden, United Kingdom of Great Britain and Northern Ireland
UUID: 6af6c512eff4af48c4b11a6b

Description: A series of cyberattacks targeting commercial refrigeration infrastructure across Europe exposed critical vulnerabilities in operational technology systems. Beginning October 2026 in France with approximately 700 affected supermarkets, the campaign expanded in November to Belgium, Luxembourg, Sweden, Netherlands, Ireland, Estonia, Portugal, Italy, Finland, Germany, and Romania. Attackers manipulated refrigeration management interfaces, altering defrost cycles and temperature settings, causing product losses and business disruptions. France attributed the October attacks to Iran's IRGC unit Shahid Kaveh, while Russian-aligned groups NoName057(16) and Z-Pentest claimed responsibility for the broader campaign. Technical analysis reveals the attacks exploited default configurations, weak passwords, and internet-exposed management systems rather than sophisticated malware. The incidents affected food retailers and attempted intrusions against meat-processing facilities and medical cold-storage systems, demonstr...

#50 [Threat Campaign] 2026-11-12: SmartApeSG ClickFix campaign pushes CNCmachineRMS RAT

MEDIUM

Date: 2026-11-13 07:37
Actors: CNCmachineRMS RAT
Source type: Threat intelligence community
UUID: 6af6a2141941c1adfc3963ca

Description: A malicious campaign utilizing SmartApeSG ClickFix (also known as BabaDeda) techniques has been observed distributing CNCmachineRMS RAT through fake CAPTCHA verification pages. The attack chain begins with compromised domains serving malicious JavaScript that injects ClickFix text for victims to paste into Windows Run windows. This retrieves an HTA file that subsequently downloads a ZIP archive containing a DLL side-loading package for deploying CNCmachineRMS RAT. The infection establishes command and control communication over TCP port 443 with encoded traffic. The campaign leverages social engineering through fraudulent CAPTCHA pages to trick users into executing malicious code, ultimately leading to RAT installation and persistent access.

#114 [Open Source Vulnerability] GHSA-x585-4vv8-2mh2: Rucio: Unauthenticated administrator impersonation through SSH challenge tokens

MEDIUM

Date: 2026-11-13 03:09
UUID: CVE-2026-100397
Source type: Open source vulnerability advisories

Description: Summary SSH challenge tokens are mistakenly accepted as valid credentials during the authentication token validation process. While an SSH challenge token is intended as a short-lived nonce for use in a subsequent SSH key exchange, the function to validate authentication tokens does not differentiate between these and actual authentication tokens. Because challenge tokens are generated based on an account name provided via headers without requiring prior authentication, an unauthenticated attacker can request a valid "challenge" token for any account (including administrative ones) and use it to authenticate against other API endpoints. Proof of Concept The vulnerability exists because SSH challenge tokens are stored in the same database table as regular authentication tokens and validateauthtoken in lib/rucio/core/authentication.py accepts these "challenge" tokens. An attacker can obtain a challenge token for an account such as “root” via the REST API and then present it as a valid authentication bearer token: 1. Request a challenge token for an arbitrary account (e.g., "root"): curl -i -H "X-Rucio-Account: root" hxxps://rucio/auth/sshchallengetoken 2. The server returns a 200 OK with the header X-Rucio-SSH-Challenge-Token. 3. The attacker can then use this specific token within the ten-second challenge lifetime as an authentication credential in subsequent requests to the Rucio API: curl -H "X-

#139 [Open Source Vulnerability] GHSA-f3w6-w445-fwh9: Active Storage: Possible arbitrary file write and read in image analysis

MEDIUM

Date: 2026-11-13 01:46
UUID: CVE-2026-122006
Source type: Open source vulnerability advisories

Description: Impact A Rails application that processes attachments with ImageMagick may allow an unauthenticated attacker to write arbitrary files on the server and, when attachments are stored with the Disk service, to read arbitrary files readable by the application process. Those files typically include secretkeybase and credentials for external systems, which may in turn allow escalation to remote code execution or lateral movement to those systems. Details ImageMagick selects a coder from the content of the file it is given, and some coders act on files named inside the image rather than on the image itself. Active Storage constrained none of ImageMagick's coders, and the ImageMagick analyzer runs when a file

is attached, so an attacker who can upload a crafted file may be able to invoke one. Attaching the upload is sufficient; no variant, preview, or analyze call is required. One specific attack chain has been reported to us, but we do not assume it is the only one that exists. The fixed versions ship an ImageMagick security policy and prepend its directory to MAGICKCONFIGUREPATH through MiniMagick.clienv, so every ImageMagick process that MiniMagick spawns applies it. The policy denies the MSL scripting coder, the coders that read or delete files other than the image, fetch remote or local references, or display to a screen, every coder backed by Ghostscript together with the gs delegate, and @filename indirection. ImageMagick applies every policy.xml on its search path, so the...
