MEDIUM

Date: 2026-11-10 10:32
Sector: Technology, Finance
Source type: Threat intelligence community
UUID: 6af2d6b5777af782c0ecd03b

Description: A sophisticated campaign targeting software developers through fake job interviews has been exposed, using a fraudulent company called AccuraSoftHire as a front. The operation lures developers through legitimate job platforms like Indeed and Glassdoor, with recruiters using identity-verified LinkedIn profiles. Candidates receive take-home coding assignments containing malicious npm packages disguised as Tailwind CSS plugins. When built, these packages deploy loaders that fetch additional payloads from remote servers using blockchain dead drops. The company's career site also serves a fake camera driver that delivers the same malware. This attack vector, linked to previous North Korean campaigns, has infected tens of thousands of machines globally and resulted in significant cryptocurrency theft, including the Binance breach exceeding six billion dollars.

#145 [Critical CVE] CVE-2026-120017: SAP NetWeaver AS ABAP and ABAP Platform does not perform sufficient verification of incoming authentication... MEDIUM

Date: 2026-11-10 02:43
Source type: Vulnerability database
UUID: CVE-2026-120017

Description: SAP NetWeaver AS ABAP and ABAP Platform does not perform sufficient verification of incoming authentication assertions under certain configurations. An unauthenticated attacker could submit specially crafted data to bypass authentication and impersonate arbitrary users, including privileged accounts. Successful exploitation could cause a full system compromise, with the impact potentially extending to connected components and systems beyond the affected system. This results in a high impact on confidentiality, integrity, and availability of the application.

Date: 2026-11-10 02:38
Source type: Vulnerability database
UUID: CVE-2026-109803

Description: SAP NetWeaver Knowledge Management (XML Forms) does not sufficiently restrict the selection of XSL transformations processed by the affected functionality. Under certain conditions, an authenticated user with access to the affected functionality could cause an unauthorized XSL transformation to be processed, potentially leading to arbitrary

code execution in the application context. Successful exploitation could impact the confidentiality, integrity, and availability of the application.

UUID: CVE-2026-109798
Source type: Vulnerability database

Description: SAP BusinessObjects Business Intelligence Platform (Web Intelligence) does not properly restrict external entity resolution when processing OLAP connection requests. An authenticated attacker could exploit this vulnerability to access restricted resources, enabling them to read sensitive files on the server and reach internal systems that are not otherwise exposed, impacting resources beyond the vulnerable component, resulting in a high impact on confidentiality and a low impact on both integrity and availability.

MEDIUM

Date: 2026-11-10 02:17
Source type: Vulnerability database
UUID: CVE-2026-76964

Description: SAP NetWeaver Application Server ABAP does not sufficiently validate certain network input processed by an internal component. An unauthenticated attacker could send specially crafted network traffic to trigger a memory corruption condition in the affected functionality. Successful exploitation could allow the attacker to execute arbitrary code and fully compromise the system, resulting in a high impact on confidentiality, integrity and availability of the system.

UUID: CVE-2026-125383
Source type: Vulnerability database

Description: INDOTALENT WHMS (Asp.Net-Core-Inventory-Order-Management-System) before 10.20261109 contains an authentication bypass vulnerability caused by a hard-coded JWT signing key, issuer and audience in appsettings.json. Unauthenticated remote attackers can forge tokens for any user ID and role that the Tokens/DI.cs validator trusts, gaining administrator access to the entire API.

Source type: Vulnerability database
UUID: CVE-2026-125384

Description: INDOTALENT WHMS before 10.20261109 contains a default credentials vulnerability that allows unauthenticated attackers to gain administrator access because UserAdminSeeder creates admin@root[.]com with password 123456. Attackers can log in with these credentials, which carry every admin role and no forced password change, to fully control deployments that kept them.

MEDIUM

Date: 2026-11-10 00:57
UUID: CVE-2026-115934
Source type: Vulnerability database

Description: An unauthenticated SQL injection can occur on the front end of any site that uses craft.search to perform a search, allowing stacked query execution and enabling escalation to an administrator.

Note that this only affects MySQL/MariaDB.

Impact * SQL injection — The attribute parameter is concatenated into the query unsanitized, and because PDO runs with emulated prepares, stacked statements execute. This gives unauthenticated read and write access to the application database.
* Privilege escalation to administrator — The write primitive was used to set the admin flag on user ID 1 in the users table, confirmed by reading the value back. Craft short-circuits its permission checks on this single column, so no further changes were needed. The same primitive can overwrite any account's password hash.

Update to the patched versions (4.18.9 and 5.11.2) to get the fix.

If you cannot update immediately, you can block front-end requests with %5Battribute%5D and [attribute] anywhere in the query string as a temporary mitigation.
Other — affected_products: CMS 4.0.0 <4.18.9; CMS 5.0.0 <5.11.2 · aliases: GHSA-grcw-mp3h-6wqj, CVE-2026-115934 · assigner: Hackrate · cvss_score: 9.3 · cvss_vector: CVSS:4.0/AV:N/AC:L/AT:N/PR:N/UI:N/VC:H/VI:H/VA:H/SC:N/SI:N/SA:N/E:A · vendor: craftcms, statamic

MEDIUM

Date: 2026-11-10 00:36
UUID: CVE-2026-125120
Source type: Vulnerability database

Description: Mongoose is a MongoDB object modeling tool designed to work in an asynchronous environment. Prior to 6.13.11, 7.8.12, 8.24.3, and 9.9.2, Mongoose countDocuments() does not apply the configured sanitizeFilter query selector injection defense. An application that enables sanitizeFilter and passes attacker-controlled filter values to countDocuments() can therefore process query operator objects as operators rather than literal values, causing the count to include documents that should not match and potentially undermining authorization or application logic based on that count. This issue is fixed in versions 6.13.11, 7.8.12, 8.24.3, and 9.9.2.

Other — affected_products: Mongoose 9.0.0, < 9.9.2; Mongoose 8.0.0, < 8.24.3; Mongoose 7.0.0, < 7.8.12; Mongoose < 6.13.11 · aliases: CVE-2026-125120 · assigner: GitHub_M · cvss_score: 9.8 · cvss_vector: CVSS:3.1/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H · vendor: Automattic

#267 [Open Source Vulnerability] GHSA-gj9m-f8ph-pmhr: GPUStack: Authentication bypass via trusted loopback source (reverse-proxy TCP peer or X-GPUStack-Real-IP header) grants unauthenticated admin

HIGH

Date: 2026-11-10 00:15
UUID: CVE-2026-102895
Source type: Open source vulnerability advisories

Description: Impact In GPUStack before v2.2.0, getcurrentuser (in gpustack/api/auth.py) promotes any request whose source is considered loopback to the built-in administrator account when forceauthlocalhost is False (the default). The "source" is derived by clientipgetter, which can be made to report 127[.]0[.]0[.]1 without any credentials in two ways: 1. Same-host reverse proxy (TCP peer). In the canonical self-hosted shape — GPUStack behind a same-host reverse proxy with proxypass hxxp://127[.]0[.]0[.]1:<port> — every remote request arrives at GPUStack with TCP peer 127[.]0[.]0[.]1, so the loopback auto-admin branch fires. No header or credential is required. Verified end-to-end against HEAD 6bee5883. 2. X-GPUStack-Real-IP header. A forged X-GPUStack-Real-IP: 127[.]0[.]0[.]1 header can cause the request source to be treated as loopback. Either path yields full, unauthenticated administrative access over the network: enumerate and modify users, models, workers, and configuration; mint persistent admin API keys (scope [""], valid from any source IP thereafter); read worker credentials and cloud/provider secrets. Combined with admin-only functionality such as POST /v2/inference-backends/from yaml, this leads to code execution on worker hosts. This vulnerability has been observed exploited in the wild against a v2.1.1 deployment (attacker-created custom backends running reverse shells). Root cause Trusting the network source of a request (socket peer, or a client-controllable header) as an authentication signal....
